

## Enjoy Top 10 Hot Songs on Zune MP3 Player

I am such a music enthusiast that I am used to listening to music when I am walking on the road, when I have a rest from work, and on the way to work. In other word, I like listening to music at my spare time. There is a list of top 10 hot songs I would like to share with other music enthusiasts.

1. Call Me Maybe - Carly Rae Jepsen
2. Wide Awake - Katy Perry
3. Payphone - Maroon 5
4. Whistle - Flo Rida
5. Lights - Ellie Goulding
6. Somebody That I Used to Know - Gotye
7. Where Have You Been - Rihanna
8. Titanium - David Guetta
9. Scream - Usher
10. Blow Me (One Last Kiss) - P!nk

I have received a Zune MP3 Player as a birthday present. And I also purchased these songs from iTunes Store. But I didn't know how to input them to the new player after I tried several times unsuccessfully. So I asked friends for help. One of my friends gave me a detailed explanation on music purchased from iTunes store, and also told me a simple solution. I also would like to share my personal experience with others who come across such problem as me.

Zune supports VBR and can play MP3, AAC (.mp4, .m4a, .m4b, .mov), JPEG and WMV files. It does not play songs purchased from iTunes store because Apple doesn't share that copy protection information with anyone else. It does not play PlaysForSure content purchased from Napster because Microsoft want people to

purchase content from their own online store launched with Zune, simply called the Marketplace. Yes, Microsoft and its partners pushed PlaysForSure heavily, but it has been something of a flop, taking only a tiny share of the iPod and iTunes dominated marketplace and featuring annoying and sometimes dysfunctional DRM. Though MS' PlaysForSure partners and heavy downloaders won't agree, it's probably for the best that MS has tried something new and hopefully better.

The Zune does support files protected with Windows Media Digital Rights Management 10, which is what songs sold on the Marketplace use for DRM.

How to transfer iTunes music to Zune MP3 Players? That's a question. We have to remove the Apple DRM protection with some third-party programs. I have tried several programs and methods. Eventually, I find one convenient to use, called **TuneClone M4P to MP3 Converter**. The following content is about how I work with TuneClone to transfer those songs to my new Zune MP3 Player.

(<http://m4ptomp3.tuneclone.com/download.html> )

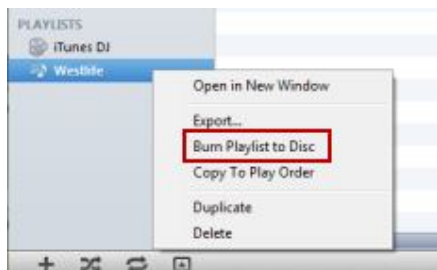

**Step1.** Create a new playlist in iTunes and add the music resource to the newly created playlist.

**Step2.** Install and run the audio converter. Click the "Settings" icon. In the pop-up dialogue, you can specify output folder, output file name, output format, etc.

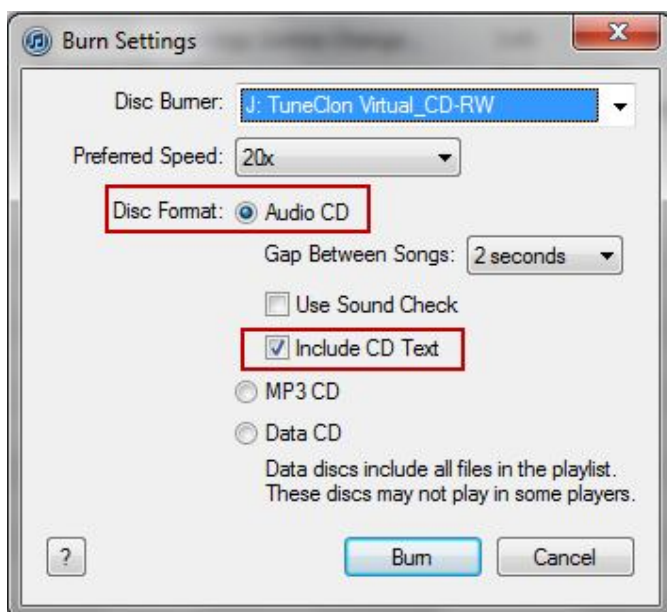

**Tips:** You can check whether TuneClone virtual CD drive is successfully installed and where it is installed at the bottom left corner of the interface.

**Step3.** In iTunes, Right click the playlist you just created and choose "Burn Playlist to Disc".

**Step4.** In the pop-up "Burn Settings", choose "TuneClon Virtual\_CD-RW" from the "Disc Burner" drop-down list, tick "Audio CD" and "Include CD Text" option. Then click "Burn" to start burning.

**Step5.** During the burning and encoding process, you can open the TuneClone manager screen to check the promotion. To locate the output folder, just click the "Folder" tab on the interface.

When you get the output music files, connect Zune MP3 Player to computer via the USB cable, drag and drop the converted music to the music folder, then you can play the iTunes M4P music on Zune MP3 Player.
