

How to Play iTunes Music on Google Play

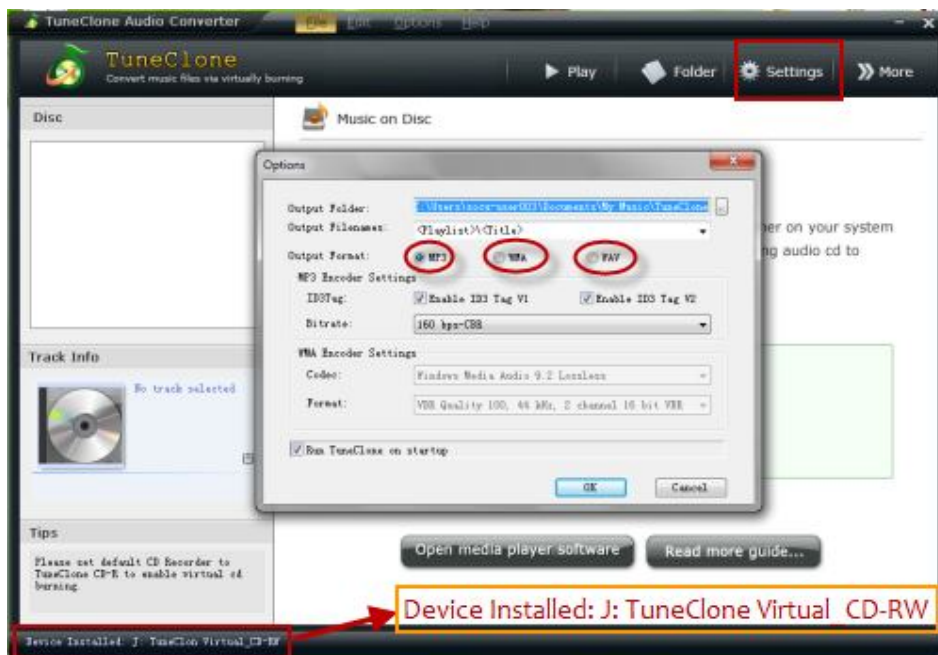

Android Play Store (formerly Android Market) has released Google Play 3.5.19 replacing the 3.5.16. Since the music purchased from iTunes store is under DRM copy protection, you cannot directly transfer iTunes songs to Google Play for playback. You need to convert iTunes music (m4p, m4a or aac) to most common used audio format mp3, and then sync the mp3 files to Google music manager.

This guide will show you how to remove DRM copy protection and convert iTunes music to mp3 playing on Google Play with **TuneClone M4P to MP3 Audio Converter**. (<http://m4ptomp3.tuneclone.com/>)

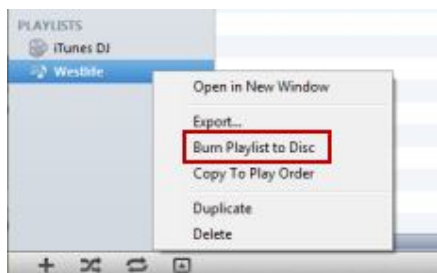

Step1. Create a new playlist in iTunes and add the music resource to the newly created playlist.

Step2. Install and run the audio converter. Click the "Settings" icon. In the pop-up dialogue, you can specify output folder, output file name, output format, etc.

Tips: You can check whether TuneClone virtual CD drive is successfully installed and where it is installed at the bottom left corner of the interface.

Step3. In iTunes, Right click the playlist you just created and choose "Burn Playlist to Disc".

Step4. In the pop-up "Burn Settings", choose "TuneClon Virtual_CD-RW" from the "Disc Burner" drop-down list, tick "Audio CD" and "Include CD Text" option. Then click "Burn" to start burning.

Step5. During the burning and encoding process, you can open the TuneClone manager screen to check the promotion. To locate the output folder, just click the "Folder" tab on the interface.

When you find the output files, just transfer them to your Google Play. Then you can enjoy iTunes music on Google Play.
