

## Share iTunes Music with Sony Walkman Player

Several days ago, a friend asked me for help that she had received a Sony Walkman Player as a gift and had purchased hundreds of songs from iTunes Store. She would like to transfer those songs to the new walkman. Unfortunately, she tried several times, but wasn't successful. So I will say something about iTunes music and how to transfer iTunes music to Sony Walkman Player.

Music purchased from iTunes store is often incompatible with some other common used MP3 Player, such as Sony MP3 Player, Panasonic MP3 Player, etc. iTunes music is under digital rights management (DRM) copy protection. So iTunes music file is called "protected AAC" with the file extension of ".m4p". In order to be compatible with non-Apple devices like PSP, Zune, Blackberry, HTC Android Phone, etc, the purchased iTunes music has to be converted into a suitable format, such as MP3, WAV, WMA, etc. I will take MP3 as an example.

MP3 is such a common media format that we can come across here and there. It is so popular because it is compatible with most media players and portable devices. Meanwhile, iTunes and apple store supply us convenience online purchasing media, they are also widely accepted all around the world. iTunes and its accessories are affecting and changing peoples' life.

In this article I am going to show you an easy way to remove iTunes music DRM protection and convert iTunes music to mp3 which is compatible with Sony Walkman Player. **TuneClone M4P to MP3 Converter** is the exact program you need. (<http://m4ptomp3.tuneclone.com/>)

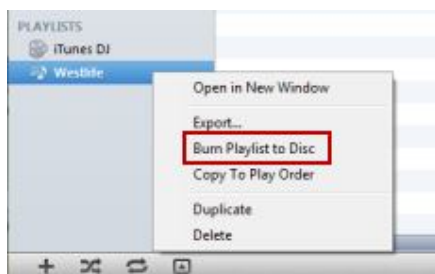

**Step1.** Create a new playlist in iTunes and add the music resource to the newly created playlist.

**Step2.** Install and run the audio converter. Click the "Settings" icon. In the pop-up dialogue, you can specify output folder, output file name, output format, etc.

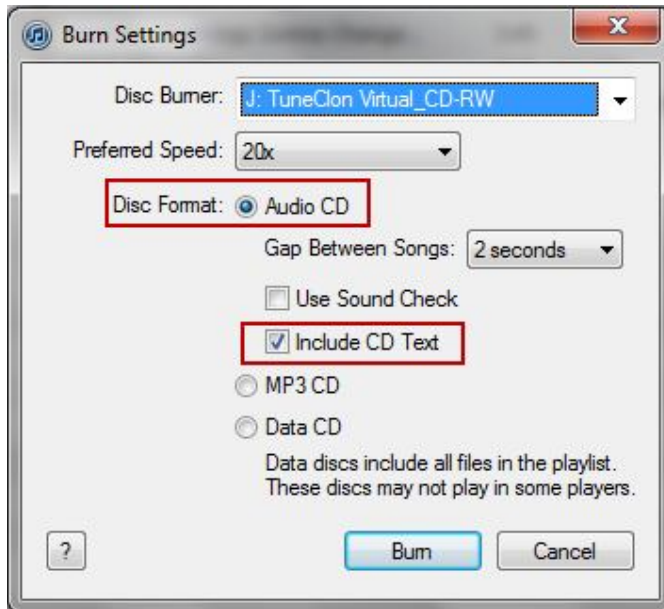

**Tips:** You can check whether TuneClone virtual CD drive is successfully installed and where it is installed at the bottom left corner of the interface.

**Step3.** In iTunes, Right click the playlist you just created and choose "Burn Playlist to Disc".

**Step4.** In the pop-up "Burn Settings", choose "TuneClon Virtual\_CD-RW" from the "Disc Burner" drop-down list, tick "Audio CD" and "Include CD Text" option. Then click "Burn" to start burning.

**Step5.** During the burning and encoding process, you can open the TuneClone manager screen to check the promotion. To locate the output folder, just click the "Folder" tab on the interface.

When you get the output music files, connect Sony Walkman Player to computer via the USB cable, drag and drop the converted music to the music folder, then you can play the iTunes M4P music on Sony Walkman Player.
